

LED STRIPS

The LED strips offer discreet lighting and can be completed with waterproof spots. Our strips can be assembled together in a line of several meters long.

These LED strips are protected by a waterproof sleeve.

They offer a quick installation, and all types of strips, white or colour, can be connected together.

**SPOTS**

Our spots are waterproof and are available in warm white as well as cold white.

This type of lighting must receive 12C current, and function with a room temperature of 50°C and 100% relative humidity.

Their electricity consumption is very low. These spots can be installed at the bottom of benches, on the ceiling, arch, or on the wall. It is recommended to install one spot per m².

We also offer a maintenance spot: this spot has a stronger light, to ensure proper lighting inside the steam room and allow for proper cleaning.

**STARRY SKY**

For a "Milky Way" effect.

The starry sky functions with a light generator. The light source is inside a metal casing, so drilling will be required. The holes will have to be of a diameter suitable for the different fibres. The casing must be easily accessible, to enable the replacement of the light bulb in the future.

Warning: to install the starry sky, you will need to access the suspended ceiling.

About 20 stars per m² will be needed.
